

MaJIC to Offer Retained Engineering Services

Materials Joining Innovation Centre continues to expand services for northern manufacturers and fabricators

Kirkland Lake, Ontario (August 12, 2013) – The Materials Joining Innovation Centre (MaJIC) is pleased to announce that it is now offering Canadian Standards Association (CSA) Retained Welding Engineering Services, for companies operating under CSA welding regulations.

As part of MaJIC's mandate of promoting the advancement of welding in industry, retained welding engineering will supplement the research, laboratory, and field services already in place. MaJIC prides itself in helping small and mid-sized organizations that lack engineering capabilities to maintain certificates, and improve the overall efficiency and effectiveness of welding in their operations.

"Many of our industry clients have asked if MaJIC is able to provide retained engineering services," said Jack Pacey, P.Eng, technical advisor for MaJIC. "With the benefits that companies [particularly those in northeastern Ontario] can experience by having access to a local welding engineer, we felt that this was an important service to develop".

By combining professional engineering services, mechanical and metallurgical test laboratories, and in-field inspection and quality services, MaJIC is now able to offer a one-stop shop for welding innovation, helping Ontario companies continue to improve their own offerings in order to successfully compete both nationally and globally.

To contact MaJIC, please email info@majic-ca.org or call 705-567-6411.
